

TECHNICAL BULLETIN

Pathways Sheet and Nattice Sheet for Ramp Use

There have been a number of inquiries on the use of these products for indoor and outdoor ramps.

The products, as manufactured, exceed the 0.8 Coefficient of Friction (COF) which was once detailed under the American with Disabilities Act, Accessibility Guidelines (ADAAG) 2002, as an acceptable COF for ramped surfaces. Thus, the products can be used in these areas subject to the following conditions:

- ◆ Like all similar resilient flooring, Pathways' and Nattice's COF will be influenced by maintenance, debris build-up on the flooring, and wear;
- ◆ Ramps will, in time, see a reduction in the COF given wear to the product's surface;
- ◆ Heavily used ramps will require a more frequent product replacement cycle;
- ◆ In all cases, ramps need to be designed in accordance with current ADA Standards for Accessible Design.

If there are any questions or concerns on these deals, please contact CBC® Technical Support at technical@cbcflooring.com.
